

1. Extend one result from the paper. This can come in a variety of forms. For example, you can suggest a robustness check and then estimate the robustness check. You could explore heterogeneity across different covariates.

2. For whatever extension you choose, write a paragraph that describes the extension. If appropriate you should also include equations that show the estimating equation for your extension.

I noticed that though they have several fixed effect models in the paper (ex. Table 7) where they consider middle school and grade fixed effects, they do not consider Mindspark Center level fixed effects. Given that this is their primary treatment instrument, and every student is going to the same center, I believe this is a useful exercise. I will recreate table 7 using the center location as a fixed effect.

3. Estimate the extension in whichever software you prefer. In your writeup, you should include the output of your extension that includes a nicely formatted table or figure, depending on what extension you chose.

TABLE 7—TREATMENT EFFECT ON SCHOOL EXAMS

	Standardized test scores					
	Hindi (1)	Math (2)	Science (3)	Social sciences (4)	English (5)	Aggregate (6)
Treatment	0.196 (0.088)	0.059 (0.076)	0.077 (0.092)	0.108 (0.110)	0.081 (0.105)	0.100 (0.080)
Baseline Hindi score	0.487 (0.092)		0.292 (0.064)	0.414 (0.096)	0.305 (0.067)	0.336 (0.058)
Baseline math score		0.303 (0.041)	0.097 (0.036)	0.262 (0.058)	0.120 (0.052)	0.167 (0.039)
Constant	1.006 (1.103)	0.142 (0.423)	0.931 (0.347)	1.062 (0.724)	1.487 (0.740)	0.977 (0.600)
Observations	597	596	595	594	597	597
R ²	0.190	0.073	0.121	0.177	0.144	0.210

Notes: Robust standard errors in parentheses. This table shows the effect of receiving the Mindspark voucher on the final school exams, held in March 2016 after the completion of the intervention. *Treatment* is a dummy variable indicating a randomly assigned offer of a Mindspark voucher. Test scores in the school exams are normalized within school $\times$ grade to have a mean of zero and a standard deviation of one in the control group. All regressions include grade and school fixed effects.

	Hindi (1)	Math (2)	Science (3)	Social Sciences (4)	English (5)	Aggregate (6)
Treatment	0.216 (0.103)	0.072 (0.086)	0.070 (0.091)	0.112 (0.118)	0.120 (0.107)	0.114 (0.085)
Baseline Score (Hindi)	0.448 (0.067)		0.266 (0.060)	0.397 (0.094)	0.298 (0.067)	0.319 (0.054)
Baseline Score (Math)		0.297 (0.032)	0.080 (0.033)	0.258 (0.051)	0.130 (0.054)	0.157 (0.036)
Observations	597	596	595	594	597	597
R-squared	0.17	0.11	0.12	0.21	0.16	0.23

4. Following the guidance earlier in the course, create a replication package for your extension which includes a README file. In your replication package you should also include your writeup. Upload your replication package to the github repository you created in Part 1 of the Replication Project.

5. Submit the link to your github repository here
